**FOR IMMEDIATE RELEASE:**

**Promimic AB Announces Partnership with Onkos Surgical<sup>®</sup> for  
Development of Hydroxyapatite Surface Technology  
(HA<sup>nano</sup> Surface<sup>®</sup>) in Limb Salvage Surgery**

**Gothenburg, Sweden, March 15, 2019** – Promimic AB, the world’s leading innovator in nano surface modification, announced today that it has partnered with Onkos Surgical, Inc., to commercialize Promimic’s proprietary Hydroxyapatite (HA<sup>nano</sup> Surface<sup>®</sup>) Surface Technologies in Limb Salvage Surgery.

“At Onkos, we are focused on bringing to market innovative products and technologies that improve personalization, reduce complexity for our customers and address the clinical challenges associated with tumor surgery,” said Sean Curry, SVP of Commercial Operations. “Tumor and revision surgery can be challenging based on the complexity of the procedures and the clinical presentation inherent with the patient population. It is well documented in literature that implant failure due to aseptic loosening remains one of the key challenges associated with limb salvage surgery. These patients deserve better and the technology exists today to design implants with unique porous structures and novel surface modifications that may result in improved implant fixation. We are excited for our partnership with Promimic as the collaboration will differentiate our ELEOS Limb Salvage Portfolio with future

designs that incorporate a uniform HA treatment which maintains the integrity of novel porous structures.” said Curry.

Steven Gitelis, MD, Onkos Surgical Chief Medical Officer and Associate Chief Medical Officer at Rush University said, “With advancements in cancer therapies, there are increased demands for long-term implant success. Improved osseointegration is critical for our patients and the use of HA with orthopaedic implants is well described. Onkos is developing the next generation of unique 3D-printed implants with novel porous structures to facilitate hard and soft tissue attachment. The development of HA deposition on porous structure is exciting as the combination may lead to improved extracortical fixation and implant survival.”

“Our unique surface technology is already clinically proven to be successful to improve osseointegration on the market for dental implants. The partnership with Onkos Surgical represents an important step for us into the orthopaedic space. The combination of technologies and working with the Onkos team is a perfect match. I strongly believe this is a start of a new era for surface enhanced implant treatments,” said Magnus Larsson, Promimic CEO. “The HAnano Surface is designed to speed up integration for all types of implant materials and has unique properties to modify porous and 3D printed structures without blocking the pores.”

### **About Promimic AB**

Promimic AB, based in Gothenburg, Sweden, develops and markets products within nano-materials for innovative surface treatments. Promimic has developed the HA<sup>nano</sup> Surface that speeds up and improves the anchoring of implants in bone. The innovative HA<sup>nano</sup> Surface is licensed to several dental and orthopedic implant companies. [www.promimic.com](http://www.promimic.com)

### **About Onkos Surgical**

Based in Parsippany, N.J., Onkos Surgical is a privately held surgical oncology company founded in 2015. We believe that individuals with cancer requiring surgery deserve solutions designed specifically for them. This principle is the driving force behind our Precision Oncology initiatives. Built on a digital platform, our solutions are rooted in unmatched expertise in patient imaging analysis, personalized surgical planning, and the latest advancements in 3D printing. At Onkos, we are passionate about reducing complexity for

our customers and addressing the clinical challenges associated with tumor surgery.
